

4.2.3 Detailed report of activities and list of students benefitted due to exposure to learning resource

Dentistry demands more of clinical exposure along with the conventional class room learning. Clinical exposure to our students starts from the 3rd year of BDS and continues up to final year MDS. To become eligible for carrying out clinical procedures, the student need a thorough preclinical training. The first and second year of BDS trains the undergraduate students in dental material science, pre clinical operative dentistry and pre clinical prosthodontics. These learning sessions are designed to improve the hand-eye coordination, manipulation of dental materials and troubleshooting during clinical procedures. The students learn the art of manipulating the dental materials used in the laboratory and clinical steps in [patient care, preparing a cavity to receive the restorations and arrangement of artificial teeth for dentures. The students are trained in fabricating complete and partial dentures and crown and bridge preparation on acrylic models and natural teeth set in preclinical prosthetics lab. The students are expected to learn the entire process of denture fabrication (both clinical and lab procedures) and prosthesis fabrication. The students practice the art of operative dentistry on plaster of paris models, typodont and natural teeth and get trained in the nuances of cavity reparation and also the students are required to have hands on experience of handling and working with the different dental materials used for restoring a tooth. The students learn to fabricate an inlay, onlay, full crown and post and core restorations along with the regular restorations on models as a part of their pre clinical training program. They also practice the skill sets required for endodontic treatment which includes access cavity preparation, biomechanical preparation and obturation of the root canal system.

In the department of pediatric dentistry, the students learn the necessary skill sets in fabrication of oral habit breaking appliances and other orthodontic and orthopedic appliances. This is in addition to the routine cavity preparation and endodontic access cavity preparation and obturation techniques.

The preclinical exercises in the department of orthodontics include fabrication of removal and fixed orthodontic and orthopedic appliances on acrylic and wax models, cephalometric tracing and model analysis.

The students have to complete a fixed number of these exercises making them understand the nuances of laboratory procedures and dental material manipulation in clinical practice. Students are trained in the practical aspects of dental anatomy through carving the tooth specimens using a wax block. This exercise helps in the future clinical dentistry. The post graduate students undergo a rigorous training for the first 6 months of their MDS course in preclinical lab refining their skills. Almost all the work which is done on a patient is practiced on dental models and mannequins in the pre clinical labs before starting the actual clinical work. Students also learn the nuances of radiographic techniques and their interpretation. The radiographic techniques range from conventional images to the advanced state of art scan like CBCT. They also learn the art of different suturing and local anesthesia techniques as a part of their pre clinical training. Suturing is learnt on a suturing pillow mimicking the mucosa in a patients mouth. Local anesthesia techniques are learnt with the help of the human skull and live demonstration by the faculty.

This stage is an important part of the UG and PG academic program. The students are encouraged to present seminars, journal clubs and discussion improving their knowledge. These exercises are carried out under the strict supervision of the faculty and they grade the student for the quality of the preclinical work. The students record all the exercises in a log book which is submitted during the end of the

academic year. Overall assessment of the student performance is based on the timely completion of these exercises and the grades for each exercise.

The institution is equipped with laboratories to train the students in acquiring these clinical skills. Also these labs help students in fabricating the prosthesis and appliances of the patients which they treat. The institution has acquired state of the art intraoral scanner and Autocad software which exposes the students to realms of digital dentistry. The laboratory services in the institution are an important aspect of student learning activity and it trains the students in various aspects of clinical dentistry.

A handwritten signature in blue ink, consisting of a stylized initial 'P' followed by a horizontal line and a small flourish at the end.
